

PROBLEMS THE POOL

# when the joy seeps on bathing

If the pool has a leak is good advice. Pooltec from here Torrevieja offers a viable solution to leak detection.

**K**nows every pool owner the problem with the Swimming pool water. on Beginning of the season is a fine and the whole familie has fun in the cool water. The pool water is clear and refreshing- exactly as it should be.

However, it may lead to water loss after a few years, with most concrete pools and pool segment by setting-cracks due to age. A nightmare for any pool owner because of water loss in their first pool is not cheap and secondly, it can rarely be accurately located. So a special company must be entrusted with the costly leak radiolocation and subsequent sealing off. And all the water is drained off and it starts a process of measuring and searching, which may extend over several days.

## WE GO THE WATER LOSS ON THE GROUND

If, despite this effort, the leak is not found, the entire pool must be sealed. On the Internet, many of pool owners (usually very expensive) takes advice. Ranging from a paint with special paint over the plaster with specialty screed up to Komplettsa-ordination everything is offered. However, the disadvantage of this is in any case that the unique design and beautiful mosaic tiles are then irretrievably gone.

However, this need not be, because we go to the enormous high water loss "on the ground!"

First of all, the pool is (damp walls, etc.) checked for obvious defects. Then you have to check the pool piping system for leaks, that is, Bodensaugleitung, skimmer and nozzle pressure line. 80% here is the cause of water loss. In most cases, these lines are leaking over the years in the joints. But also become porous and brittle PVC tubing can lead to water loss. To determine which is leaking these lines, we are moving with special pump and sealing plugs to grips with the problem. The lines are pressurized with about 2 bar then shows where each leaky activity. For this work, the cost is relatively low. At the bottom line, however, it looks a little different. To pull off this, the drain must be sealed with a special stuff so we can get pressure on the Bodenlei maintenance and for that we need to dive. All lines should be tight, you can exclude this source of error (lines) and must find the error elsewhere, such as cracking in the concrete.

### Cracking

In most cases, a crack in the foundation of your pool stands out so that your joint is a deep black mosaic tiles and can no longer be cleaned. There the water penetrates, seeps and leads to water loss.

For larger tiles such as this are 12.5 x 12.5 cm mostly torn, because the surface of the tiles is greater and the crack can then drag across multiple tiles in the longitudinal direction. To fix this error, it must be decided individually on site. As a rule, the water must be drained, the sites must be torn open, etc.

### Leak detection and localization by a specialist

We are with our special technology capable of after construction of swimming pool leak detection device in the general pool area, leakage, damage or loading smallest holes. If the Poolwandung in the pool no damage be present, we are able to verify the pool lines and locate broken pipes or damage selectively. Thus, the entire pool system can be checked to determine the cause of a water-Lustes. In short order, we ensure that your pool is tight and it stays.

For many years our passion to the swimming pool. We design, implement and maintain your dream pool. We will advise you uncomplicated your new construction or renovation- so the bathing nothing stands in the way.
